CDS Moving Equipment manufactures and supplies the transportation industry with the highest quality cargo control equipment available. If your cargo restraint requirements are unique please contact us. We can design a system to suit your needs.

Please read the important information regarding what load capacities really mean. We believe that purchasers and the user must understand the correct application and the strength of the strap assemblies purchased. The user should evaluate working load requirements before selecting appropriate hardware and strap assemblies. Remember, all strap assemblies or systems are as strong as their weakest component, including the point of attachment.

WHAT IS WORKING LOAD CAPACITY? This is the maximum load a component or assembly should be subjected to during routine use. For your safety, CDS recommends that “working load capacity” not exceed one-third (1/3) the component an/or assembly “breaking strength capacity”.

WHAT IS A RATED LOAD Capacity? Ratings are generally established and/or regulated by industry or legislative standards and may vary from industry to industry. For example, the 1387 California Highway Patrol rating for flatbed tie-downs is established at 70% of the breaking strength capacity of web binders or 80% of the breaking strength capacity or force required to cause permanent distortion of component hardware, whichever is less.

IT IS THE OWNERS’ AND USERS’ RESPONSIBILITY TO DETERMINE SUITABILITY OF A PRODUCT FOR ANY PARTICULAR USE. CHECK ALL APPLICABLE INDUSTRY, TRADE ASSOCIATION, FEDERAL, STATE AND LOCAL REGULATIONS. READ ALL OPERATING INSTRUCTIONS AND WARNINGS CAREFULLY.

All ratings shown in this catalog are based on the product being new, and applied in normal environmental conditions. Special consideration must be given to item selection when unusual conditions can be expected. Particular caution should be exercised to avoid exposing the product to sharp or abrasive edges or acids.

Products are subject to age, wear and deterioration, all of which cause a reduction in the products’ breaking strength capacity. We recommend that all products be regularly inspected. ANY WORN, DEFORMED, MISUSED OR OVERLOADED PRODUCTS SHOULD BE REPLACED IMMEDIATELY.

REMEMBER: The component with the lowest breaking strength capacity in the entire system will probably fail first. Each component of the entire systems plays and important part in restraining cargo. It is important that tie-downs be attached to components that are of sufficient strength to properly secure the load. For example, if one anchors a standard web binder assembly with a rated load capacity of 12,000 lbs. to a device with a breaking strength capacity of 5,000 lbs., then that system will fail at 5,000 lbs.

This information is provided to you because we believe that purchasers and the user must understand the correct application and strength of products purchased.

B&P ALUMINUM VAN RAMPS

B&P ramps are portable and strong. All ramps have improved traction to prevent slipping. Level-off apron at the top creates a smooth transition from the ramp to the deck of your truck.

### RAMP HEIGHT

Matching the length of a ramp to the service height is important. Too short of a ramp will create a steep slope making it hard to move and control heavy items. B&P ramps are designed with a slanted lip at the top of the ramp to match the ramp angle to the flat platform at the top. Using the incorrect length ramp may prevent a smooth transition at the top of the ramp.
